

| If you want to ... | Go To |
|--|-------|
| I want to show my entire desktop to the audience. Every action I perform should be visible to everyone. I want to use it for teaching or demonstrating software features. | 1 |
| I want to show document or app running on my PC to the entire audience. Very useful for live demos. I want to get instant edits or annotation from someone, give her control. | 2 |
| I want to upload a presentation before the meeting, present it to the audience without refresh delay. I want to control the presentation, skip slides and allow users to annotate. | 3 |
| I want to edit an urgent document with other remote attendees. If everyone can see each other's edits, I can create time-bound documents very quickly – without using CCs. | 4 |
| I want to distribute my PPT file, related workbooks and other technical files to my audience, right within the meetings. They should be able to download and use the files. | 5 |
| I don't want everyone to take notes on their own. I want everyone to type their notes and view / correct other's notes. I want everyone to be, literally, on the same page. | 6 |
| I just want to take notes on my own and keep them for future reference. | 7 |
| I want to see all the content available – shares, attachments, etc. and use it as required. I also want to control who can see and download the attachments. | 9 |
